UID PROJECT

AIM:

The aim of this project is to develop an Amazon frontend clone using HTML, CSS and JavaScript. The project is designed to demonstrate frontend web development concepts such as responsive design, search functionality, product display, category filtering, popup system and cart management.

OUTPUT:

EXPLANATION:

This is my Amazon Frontend Clone Project developed using HTML, CSS and JavaScript. The main aim of this project is to create an Amazon-like shopping website interface and demonstrate frontend web development concepts.

In this project, I implemented features such as navbar, search bar, menu bar, hero slider, product cards, category filtering, popup system, cart system and responsive design. The project is completely frontend-based and does not use backend or database connectivity.

HTML, CSS and JavaScript Complete Explanation

HTML Explanation:

HTML stands for Hyper Text Markup Language. It is used to create the structure and content of the website. In this Amazon frontend clone project, HTML is used to design different sections such as the navbar, logo, search bar, menu bar, hero slider, product cards, product

rows, popup boxes, cart section and footer. Different HTML tags like div, section, header, footer, image, input, button, h1, h2, p, span and select are used throughout the project.

The navbar section contains logo, address, search bar, account, orders and cart. Product cards and product rows are created using container divs. Popup boxes are created for login, location and cart sections. Footer contains links and project information. HTML also connects external CSS and JavaScript files using link and script tags.

CSS Explanation:

CSS stands for Cascading Style Sheets. It is used to style and design the website. In this project, CSS is used to give Amazon-like appearance using colors, spacing, font sizes, layouts and animations. Flexbox is used for arranging navbar items, search bar, hero section and product layouts in horizontal order. Grid layout is used for product cards and footer columns.

CSS is also used for hover effects, button styling, popup design, product card design and responsive layout. Background colors, borders, padding, margins and transitions are added using CSS. Media queries are used to make the website responsive for desktop, tablet and mobile screens. The popup boxes are centered using position fixed and transform properties. Product images are adjusted using object-fit property.

JavaScript Explanation:

JavaScript is used to make the website dynamic and interactive. In this project, JavaScript handles search functionality, category filtering, popup system, cart system, hero slider and dynamic product rendering. Products are stored inside arrays and objects. Category-wise products are stored inside categoryData objects.

When the user clicks category options in the menu bar, JavaScript dynamically displays related products. Search suggestions are displayed while typing in the search bar. Product detail pages are created dynamically using innerHTML and DOM manipulation. The cart system stores products inside arrays and updates the cart count dynamically.

JavaScript functions like openPopup(), closePopups(), showCategory(), searchProducts(), addToCart(), showCart() and changeHero() are used throughout the project. Event handling is done using onclick, oninput and onchange events. JavaScript also updates the hero banner dynamically when arrows are clicked.

Responsive Design Explanation: Responsive design is used to make the website adjust automatically on different screen sizes. Media queries are used to change layouts for mobile and tablet screens. Flexbox and Grid help the website rearrange elements properly. The search bar, navbar and product layouts become mobile-friendly when screen size decreases.

Conclusion:

This Amazon frontend clone project is developed using HTML, CSS and JavaScript. The project demonstrates important frontend concepts such as webpage structure, styling, responsive design, arrays, objects, event handling, popup systems, cart systems, category filtering, search functionality and dynamic DOM manipulation. The project provides an Amazon-like user interface and user experience using only frontend technologies.
